**Note:** \* A distorted *Infundibulicybe geotropa* was found under the boardwalk at the S.E. corner of the moat. The 'rosecomb' distortion is thought to be due to the preservative used in the wooden planks of the boardwalk. (The planks had been tanalised.) This find, with photo, was reported in 'Field Mycology' Vol. 21(1), January 2020 p32. Thanks are due to Alick Henrici for his help in resolving this mystery.
